

## FERROTRACE

**Shake** canister well before spraying

**Spray** directly on hand from a distance of 4" inches in short bursts. Allow a few seconds between bursts until solvent dries. **DO NOT** saturate

**Observe** for dark violet marks (coloring) on hands.

**Photograph** results

**FERROTRACE** is an iron image detection spray that reveals the invisible iron trace residue of a weapon on skin (like hands). It can be used on porous or non-porous surfaces.

If one wishes to test for gun-shot residue, this should be done **BEFORE** using Ferrotrace.

Results with Ferrotrace can be enhanced by first wetting the skin to be tested. In fact, another method of testing (aside from directly spraying the hands) is to wipe the skin with damp filter paper, and then spray the filter paper.
